6. Find the central angle of each of the sectors whose measures are given below. $\left(\pi = \frac{22}{7}\right)$

   (i) area = 462 cm^2, r = 21 cm (ii) length of the arc = 44 m, r = 35 m

7. A circle of radius 120 m is divided into 8 equal sectors. Find the length of the arc of each of the sectors.

8. A circle of radius 70 cm is divided into 5 equal sectors. Find the area of each of the sectors.

9. Dhamu fixes a square tile of 30 cm on the floor. The tile has a sector design on it as shown in the figure. Find the area of the sector. $(\pi = 3.14)$.

10. A circle is formed with 8 equal granite stones as shown in the figure each of radius 56 cm and whose central angle is 45°. Find the area of each of the granite stones. $\left(\pi = \frac{22}{7}\right)$

2.3 Combined shapes

In our day-to-day life, we use infinitely many things with shapes like circle, triangle, square, rectangle, rhombus etc., don't we? We use them separately as well as with two or three or more shapes combined together as shown in the following figures.

			
Glass window	Model house	Invitation card	Locker

What do we observe from the above figures?

The shape of a glass window is like a semi-circle placed over a rectangle whereas the front – facing wall of a model house looks like a triangle over a square.

Likewise, list the shapes used to make an invitation card and a locker.

Thus, two or more plane figures joined with the sides of same measure give rise to combined shapes.
